Teaching Nutrition in Saskatchewan

Health Education Grades 1-3

Developed by: Saskatchewan Health Authority Public Health Nutritionists

The purpose of *Teaching Nutrition in Saskatchewan: Concepts and Resources* is to provide credible Canadian based nutrition information and resources based on the Saskatchewan Health Education Curriculum (2010).

The **Nutrition Concepts and Resources** section, found on pages 4 -13 in this resource, identifies nutrition concepts and resources relating to grade-specific provincial Health Education curriculum outcomes. These lists only refer to the curriculum outcomes that have an obvious logical association to nutrition. They are only suggestions and not exclusive.

The **Nutrition Background Information** section, found on pages 14-25 provides educators with current and reliable Canadian healthy eating information.

For more information, email the Population Health Department at: populationhealth@saskhealthauthority.ca

Teaching Nutrition to Children

Teaching about food and nutrition is important for the health and wellbeing of students. Below are some tips for teaching nutrition to children:

- Use current and creditable nutrition information. *Teaching Nutrition in Saskatchewan* and dietitians are great sources of reliable nutrition information. When searching for health information on the internet, refer to [How to find food and nutrition information you can trust](http://Unlockfood.ca) for a few tips to make sure you get the best information.

- Include cross-curricular connections in the classroom. For example, when teaching fractions in math, illustrate the lesson using fruit instead of pie. Choose books and projects that show healthy food and eating habits. For examples of how to link nutrition to other Saskatchewan curricula, refer to [The Saskatchewan Curricular Outcomes and Nutrition](http://Nourishing Minds Eat Well Learn well Live Well).

- Spread healthy eating lessons out throughout the year rather than in a short unit. Connect key messages to special events or classroom celebrations by offering or asking students to bring healthy options.

- Use experiential learning strategies to engage students. Let students work with food in the classroom, visit a grocery store, start a cooking club or a school garden. If you are considering offering taste tests, check out [Taste Testing](http://Apple Schools).

- Avoid labelling foods as ‘good’ vs ‘bad’ or healthy vs unhealthy. Allowing kids to explore and learn about food while keeping it positive and language neutral will lead to better eating habits than avoidance-based education strategies like ‘don’t eat sugar’ or ‘saturated fat is bad.’

- Promote a positive relationship with food and physical activity without encouraging dieting or weight loss attitudes and behaviours. Ensure that all students, regardless of weight, shape or size, are equally valued and respected. Enforce that it is not acceptable to label fatness as bad or make comments about people’s size or shape. For more information refer to *Weight Bias* on page 21.

- Be a good role model for students. Avoid talking negatively about foods or discuss dieting, weight loss or dissatisfaction of body shape or size.

- Do not make comments about student lunches or snacks and do not take food items away if they are not considered “healthy.” Eating looks different to everyone and what and how much people eat will depend on many factors. Children may have little control over what is in their lunch. Drawing attention to “unhealthy” choices can isolate children from their peers and cause them to feel shame. Remember, no one food or meal defines our eating habits. If you have concerns about a student’s lunch talk to the parents separately in a non-judgemental manner.

- Allow all students to make their own decisions about what and how much to eat and drink from their lunches. There is no benefit to having children eat certain foods before others such as eating a sandwich before a cookie. Children eat better when they can pick from the available options in the order they want.

Background Information

Canada’s Food Guide – 2019

Canada’s Food Guide has provided Canadians with healthy eating recommendations since the 1940’s. Over the years, the Food Guide provided guidance around the types and amounts of foods to eat for health. Rather than identifying the specific amounts of foods to consume each day, the healthy eating recommendations for the 2019 version of the Guide provide key messages in choosing healthy foods and eating habits.

Canada’s Food Guide Healthy Eating Recommendations

Food Choices

Make it a habit to eat a variety of healthy foods each day.

▪ **Eat plenty of vegetables and fruits, whole grain foods and protein foods.** Choose protein foods that come from plants more often. Protein foods include legumes, nuts, seeds, tofu, fortified soy beverage, fish, shellfish, eggs, poultry, lean meat, lower fat milk, lower fat yogurt and cheeses lower in fat and sodium. Choose foods with healthy fats instead of saturated fat.

▪ **Limit highly processed foods. If you choose these foods, eat them less often and in small amounts.** Prepare meals and snacks using ingredients that have little to no added sodium, sugars or saturated fat. Choose healthier menu options when eating out.

▪ **Make water your drink of choice.** Replace sugary drinks with water. Replacing sugary drinks with water will help reduce the amount of sugars you drink.

▪ **Use food labels.** Food labels provide information you can use to make informed choices about foods and drinks at the grocery store and at home.

▪ **Be aware that food marketing can influence your choices.** Food marketing is advertising that promotes the sale of certain food or food products. Many marketed foods and drinks can contribute to too much sodium, sugars or saturated fat to our eating patterns.

Healthy Eating Habits

Healthy eating is more than the foods you eat. It is also about where, when, why and how you eat.

▪ **Be mindful of your eating habits,** taking time to eat and noticing when you are hungry and when you are full.

▪ **Cook more often.** Cooking more often can help you develop healthy eating habits. You can cook more often by planning what you eat and involving others in planning and preparing meals.
▪ **Enjoy your food.** Enjoying your food is part of healthy eating. Enjoy the taste of your food and the many food-related activities that go along with eating. This includes enjoying culture and food traditions.

▪ **Eat meals with others.** Enjoying healthy foods with family, friends, or neighbours is a great way to enjoy quality time together, share food traditions, across generations and cultures, and explore new healthy foods that you might not normally try.

Several tips, resources and recipes to implement Canada’s Food Guide recommendations into daily habits are available at [food-guide.canada.ca/en](food-guide.canada.ca/en)

References:

Healthy Eating Habits for Children

Eating nutritious meals and snacks helps children meet their daily nutrient needs for healthy growth and development. To help sustain energy, children need to eat small amounts of food on a regular schedule.

Eating Breakfast

It is important to start every day by eating breakfast. Breakfast replenishes energy lost during a night’s sleep. Skipping breakfast may result in missed nutrients, and fatigue.

A healthy breakfast includes vegetables or fruit, whole grain and protein foods. Examples of breakfasts include:

- Whole grain cereal, milk, banana
- Whole wheat toast, scrambled egg, orange
- Plain oatmeal, yogurt, berries
- Whole grain bagel, nut butter, apple
- Whole grain tortilla with beans and cheese

Healthy Snacks

Snacks that include vegetables and fruit, whole grains and protein foods help children meet their daily nutrient needs. Healthy snacks include food from Canada’s Food Guide. Examples of healthy snacks include:

- fruit with yogurt dip
- sliced vegetables with hummus (chickpea dip)
- whole grain crackers with cheese
- half of a sandwich and milk
- fruit and yogurt smoothie

Sometimes there is confusion regarding snacks. Some foods advertised as “snack foods” are high in fat sugar and salt such as chips, candies, soft drinks, chocolate covered granola bars, cookies, fruit flavoured snacks, and cakes. These are not healthy snacks and should not be served or sold in schools.

References:

Teaching about Food in the Younger Grades

Eating habits and attitudes about food developed in childhood and the teenage years, often follow through into adulthood. Nutrition education in the young grades should provide for positive language, food experiences and positive attitudes regarding eating to help children maintain a healthy relationship with food, and eating.

Try to avoid using phrases such as “good foods” and “bad foods” or healthy vs. unhealthy. This type of language can create negative associations with food. For example, when a child eats what a “bad food”, he/she may perceive himself/herself as “being bad.” This association puts a moral value on food, which can lead to unhealthy eating habits and can also further stigmatize and disadvantage kids who may not have a lot of “good” or “healthy” options to eat at home.

Instead of classifying foods as good or bad, healthy or unhealthy, focus on food experiences, food facts, food skills, and food relationships. For more information visit: Healthy Relationship with Food | Alberta Health Services

Activities that ask children to track their food intake, count calories, evaluate their own intake or connect food choices to weight, reinforce harmful dieting attitudes and behaviours, which is a major risk factor for the development of anxiety around food and eating disorders (1-3).

For ideas regarding food experiences and healthy attitudes regarding eating refer to Food Experiences (page 16) and teachfoodfirst Guiding Principles for Educators).

For more information regarding healthy foods in schools, refer to the Ministry of Education guidance document, Nourishing Minds Eat Well – Learn Well – Live Well (2019) at:

References

**Food Experiences**

Food experiences at school and in the classroom provide children with opportunities to try nutritious foods in a positive environment. Children are more likely to try healthy foods when they see adults and other children enjoying these foods. The more often children are around a new food, the more likely they are to try it. When offering foods in the classroom, proper hand washing is very important.

**Tips for Success**

- The goal of a food experiences is to introduce students to new foods. Offer small tastes, not large portions.
- Children are often happy to be involved in food preparation. Touching, feeling and smelling food before tasting is part of the learning process for many children.
- Allow and instruct students to refuse trying a food by saying “no thank-you” and discourage negative comments.
- Offer foods with a napkin and instruct to spit food into the napkin politely if they do not want to swallow it. Have drinking water available. Even just having it in the mouth is a food experience. Do not force a child to eat something they do not want to eat, this can lead to food aversions later on.
- Food acceptability changes over time. Avoid asking whether they liked the food but instead, ask them to describe the food by its taste, texture and appearance.
- Have students keep track of new foods they have tried. When students share this with their families, it encourages them to try these foods at home.

**About Children’s Food Acceptance**

It is normal for some children to be more cautious with foods. Children may need to experience a new food eight or more times before they will taste it (1). Children who have very keen sense of taste or smell may find strong tastes or smells not initially appealing. Mouth feel, colour, shape and presentation of a food can influence whether a child will try it. Also past experience with a food can affect if it will be accepted in the future.

Reference:

Factors Influencing Food Choices

Children’s eating habits are continually developing and changing under the influence of family, peers, adult role models and social environments such as media and marketing.

- **Social Environments:** Eating is often a social event. If children see their friends enjoying healthy foods, they will be more likely to like those foods. Adult role modeling is also extremely important in shaping children’s eating habits.

- **Advertising of Food and Beverages:** Food advertising has increased over the last few decades. Most foods advertised are high in fat, sugar, salt and calories. Children are particularly vulnerable to advertising. Food marketing builds brand loyalty and impacts the foods kids eat.(1).

- **Culture:** Culture and food traditions affect eating habits. They influence the type of foods offered as well as how they are prepared and served.

- **Hunger and fullness:** Although the feelings of hunger and fullness are innate, many things can interfere with children’s ability to sense them. For example, rewarding children with food or punishing them by restricting foods can interfere with their ability to eat in response to hunger and fullness cues. This can teach children to eat as a way to reward themselves instead of eating due to hunger.

- **Emotions:** Emotions can affect our eating habits. They can lead us to overeat, avoid eating or make us choose different foods. For example, in times of celebration or sadness some people may eat more or less or eat different foods than they usually eat. The association between emotion and food is normal, but it can be problematic if it becomes the usual way to deal with emotions.

- **Availability:** The food available to children is dependent on what is available locally and how parents and caregivers can access the food. Food is often available at nontraditional locations such as bookstores, hardware stores, and gas stations. Many foods purchased in these locations are high in fat, salt, sugar and low in vitamins and minerals. Even if food is available, it may not be accessible due to cost.

- **Time:** Time commitments and competing priorities influence the types and locations of foods eaten. Some families may turn to fast-food restaurants, ready-to-serve dinners and packaged foods. These foods tend to be less nutritious than foods prepared at home with basic ingredients.

- **Family Income:** There are many reasons why families may not have enough money to obtain enough food or the healthy foods. The rising costs of basic expenses such as transportation, childcare and housing sometimes leave families with less money for food.

- **Taste Preferences:** People experience the taste, texture, and smell of food differently. Some people have keener senses than others do.

For more information, see *Food Experience* (page 16).

References

Go, Grow and Glow

The concept of “Go, Grow and Glow” foods helps students understand that:

- The foods we eat play a role in a variety of body functions that keep us healthy.
- We need to eat a variety of foods to be healthy.

“Go, Grow and Glow” simplifies the concept that nutrients in food play important functions in our bodies. Keep in mind this is an oversimplification and in fact, foods provide a variety of nutrients. Centre the discussion around types of foods.

**Water and Other Beverages**

**Importance of water to health**

Water is the largest part of the human body and is vital for life (1). Water is a structural component to all cells and is essential to all bodily fluids. Water transports nutrients and removes wastes from the body.

Our bodies naturally lose water throughout the day through breathing, urine, bowel movements and sweat. Water losses increase in hot environments, during physical activity and during illness. Fluids need to be replaced for the body to function well and prevent dehydration. Some symptoms of dehydration include thirst, fatigue, weakness, headache, irritability, and dizziness.

Canada’s Food Guide recommends water as the beverage of choice to support health and hydration without adding calories or sugar found in other beverages.

**Other beverages**

Sugary drinks, including 100% juice, are associated with dental cavities in children. Sugar sweetened beverages and foods have been associated with weight gain and type 2 diabetes. To help reduce the intake of sugar, it is important to limit or avoid sugary drinks (1).

**Weight Bias**

Weight bias refers to negative attitudes towards individuals due to their weight. These negative attitudes result in stereotypes, prejudice and unfair treatment towards these people. This can be expressed through teasing, physical aggression, cyber-bullying, rejection, and rumors. Not only can this be embarrassing for a child, youth or adult, it can also have serious consequences on their physical, social and psychological health.

**Why does weight bias occur?**

Weight bias occurs because we live in a culture where there is a perception that being thin is desirable. We are exposed to misleading messages about weight from various means such as television, movies, books, magazines and the internet. These false messages tell us people are “bad if they are fat” or “good if they are thin”. A consequence of these messages is that it is socially acceptable to judge people’s characters, personalities and behaviours based on weight. For example, overweight people are often perceived as being lazy, lacking will power, and being unreliable. When family members, friends, and education professionals reinforce these false messages, individuals can be stigmatized and hurt.

**How does weight bias affect students?**

Children and youth who experience weight bias are vulnerable to many consequences that can affect their emotional and physical well-being. Students who experience teasing or discrimination because of their weight can have low self-esteem, poor body image, and are more likely to experience symptoms of depression and anxiety. A student’s physical health may also be affected in various ways. Children who experience weight biases are more likely to try unhealthy weight control or binge eating behaviours and avoid physical activities at school where teasing often occurs.

**Taking action**

All people deserve safety, respect, and acceptance in their community and classroom. Just as we should not tolerate racial or gender bias toward others, we should not tolerate weight bias. If you witness weight bias occurring in your school, intervene right away. For more information on how to take action read ODPH: Mental Health and Weight Bias in Schools.

**Weighing and measuring students in schools**

Measuring children and youth within the school setting can be more harmful than beneficial. Children and youth are often teased about their size and shape. Measuring weight or body composition at school can increase the amount of teasing children may already be receiving. Regardless of their size or shape, children and youth may be pressured to try harmful diets. Body composition can influence health but research has shown that shaming people for their size does not improve their health (1).

All students need to be physically active, eat well, and have positive mental health regardless of their size and shape. It is important to be supportive of all children and youth by keeping the focus on health and wellness and off size and shape.

**Family Meals**

Children and parents can benefit from eating meals together. Family meals have been associated with enhancing family relationships and supporting healthy choices (1, 2, 3, 4).

Eating together can promote conversation and laughter that allow families to reconnect each day. This becomes even more important as children get older. Research has shown that families who eat together have stronger relationships and communication. By enjoying meals together and sharing conversations, children can learn important family values and traditions. As families come together to eat, it provides the child with a sense of belonging and security.

Research has shown that children who partake in family meals are less likely to engage in risky behaviors such as the use of alcohol, tobacco, and other drugs (1). This may be due to the relationship between participating in family meals and children’s ability to resist negative peer pressure. Participating in family meals has also been linked to positive mental health (2).

Children who eat meals with their families are more likely to develop healthy eating habits that can continue into adulthood. Family meals have been associated with children eating more foods with fiber, calcium, iron, and essential vitamins and drinking less soft drinks (4).

Eating together as a family can be a great opportunity for parents to demonstrate healthy behaviours to their children. Including children in meal preparation and clean up allows the child to feel included and learn valuable lifelong skills.

Taking Action on Healthy Eating

As part of the Saskatchewan Health Education curricula students are to make decisions to enhance their personal health. Try to gear the focus on positive healthy eating actions such as choosing to drink water or trying a new vegetable rather than restrictive actions like avoiding candy or soft drinks. Focusing on the positive aspect of eating to help maintain or develop a good association with healthy foods.

Have students brainstorm specific ideas to improve their eating habits. Below are a few examples:

- eat vegetables or fruit at meals or choose to try at least one new vegetable a week
- try a few whole grains like brown rice or whole grain bread
- choose to eat breakfast at least 3 times a week
- drink water at each meal

Often children’s access to food is dependent on their parents or caregivers. Some students will struggle to make changes to their eating habits based on what type of foods are available to them. Having access to healthy food at school can assist students in taking action on healthy eating. Here are a few ideas to help keep the school and classroom inclusive to all students:

- Have free drinking water available in the school
- Consider keeping a fruit basket in the school office or library for students who do not have access to these foods
- Offer white milk at no or low cost at school
- Approach organizations and businesses for financial donations to offset the cost of emergency foods in the school.
- Highlight a vegetable or fruit in the classroom each month – provide small taste tests and encourage children to try something new.
Accessing Health Information On-Line

We often get health information from the internet through social media and websites. It is hard to know which source is the best. It is important to inform students of ways to ensure the information from the website can be trusted. Below are a few tips when looking for health information online:

1. **Who hosts the website?**
   - Look for information from government authorities such as Health Canada, health authorities, or from national charities such as the Heart and Stroke Foundation, Canadian Cancer Society, or Diabetes Canada. These sources report reliable health information.
   - Be wary of websites advertising or selling things that are supposed to improve your health. Many of these companies include false or misleading scientific claims to encourage you to buy their product.

2. **Is the information reliable?**
   - Check the author’s credentials. Not all information is written by qualified health professional. There are many phony health professionals making false claims on the Internet.
   - Some qualified health professionals may also reference poor scientific studies with misleading information. It can be important to take a closer look at the articles backing up their claims (see backgrounder Reading Health Studies p. 20)
   - Health information should be unbiased and based on solid evidence. The author should refer to and provide the specific links to this evidence.
   - Be cautious about personal stories and opinions. They are not always objective or based on evidence. Some websites may even have a cautionary note or full disclaimers that the information provided is purely based on opinion and not on scientific evidence.

3. **When was the information written?**
   - Look for websites with current health information. The date of the information is often at the bottom of the page. Look for information from the last 5 to 10 years.

4. **Does the website offer quick and easy solutions to your health problems?**
   - Be careful of health information that claims that one pill or food will cure many different illnesses.
   - Be cautious of articles that try to make people fearful or recommends therapies, which produce amazing or ‘miracle’ cures. Look for other reliable websites to see if they provide the same information.
   - Talk with a trusted health care professional about what you learn online before making any changes in your health care or eating plan.
